

MULTIPLE MANUFACTURERS... UNLIMITED MESSAGE BROKERS... ONE SOFTWARE – AWA

The Airport Weather Advisor® Message Broker is a component of the AWA software that receives data from a weather station and then translates the data into a format that AWA can use to produce standard weather reports. Mesotech can integrate unlimited Message Brokers into AWA, each configured to receive data from

a specific weather station, regardless of manufacturer. This technology allows users the flexibility to use weather monitoring equipment from multiple manufacturers, yet benefit from the efficiency of one software display and reporting system. This also allows for seamless upgrades of

older system that just require modern reporting software. Adding a specific manufacturer's weather station is as simple as choosing the item from a drop-down menu. And regardless of the number of Message Brokers, AWA's algorithms and reporting functionality are identical for each weather station.
